

Broken Movement

The Neurobiology of Motor Recovery after Stroke

John W. Krakauer and S. Thomas Carmichael

**The MIT Press
Cambridge, Massachusetts
London, England**

Contents

Preface xi

Acknowledgments xiii

1 The Current Landscape of Upper Limb Neurorehabilitation 1

- 1.1 Introduction 1
- 1.2 The Many Faces of Motor Recovery 1
- 1.3 True Recovery versus Compensation 3
- 1.4 (Mis)measures of Arm Paresis 3
- 1.5 Current Upper Limb Neurorehabilitation: What Is Done, and Does It Work? 8
- 1.6 Conclusions 10

2 Upper Limb Paresis: Phenotype, Anatomy, and Physiology 13

- 2.1 Introduction 13
- 2.2 The Modern History of Hemiparesis (Part 1): Sherrington, Tower, and Walshe 13
- 2.3 The Modern History of Hemiparesis (Part 2): The Lawrence and Kuypers Studies in the Macaque 17
- 2.4 Weakness 20
- 2.5 Residual Motor Control and the Idea of Synergies 24
- 2.6 The Dissociation between Strength and Motor Control 27
- 2.7 The Contributions of the Corticospinal and Reticulospinal Tracts to Strength and Control 33
- 2.8 Poststroke Resting Posture 36
- 2.9 Abnormal Postural Control Mechanisms during Movement 37
- 2.10 Spasticity 41
- 2.11 The Relationship between Lesion Location and Arm Paresis Phenotype after Stroke 46
- 2.12 Remote Physiological Effects: Diaschisis 47
- 2.13 Remote Physiological Effects: The Interhemispheric Competition Model and the Use of Noninvasive Brain Stimulation for Treatment of Hemiparesis 50

2.14	The Ipsilateral "Unaffected" Arm	53
2.15	Conclusions	57
3	Acute Hemiparesis: Spontaneous Biological Recovery, the Effect of Training, Sensitive Periods, and Reorganization	59
3.1	Introduction	59
3.2	The Modern History of Motor Recovery after Stroke: Hughlings Jackson, Leyton and Sherrington, Ogden and Franz	59
3.3	The Modern History of Motor Recovery after Stroke: Twitchell and Brunnstrom	64
3.4	The Natural History of Recovery of Hand and Arm Impairment	67
3.5	The Proportional Recovery Rule	68
3.6	The Recovery of Motor Control in the Arm and Hand: Kinematic and Kinetic Measurement	77
3.7	The Interaction between Spontaneous Recovery and Training: Repair versus Learning	84
3.8	A Sensitive Period of Increased Responsiveness to Training	95
3.9	Relevance of Rodent Models to Human Stroke	98
3.10	Recovery and Brain Reorganization	100
3.11	Conclusions	106
4	The Molecular and Cellular Biology of the Peri-Infarct Cortex and Beyond: Repair versus Reorganization	111
4.1	Introduction	111
4.2	Regions of Stroke Damage	112
4.3	Triggers for Neural Repair Radiate Outward from the Infarct Core	116
4.4	Excitatory/Inhibitory Balance in Peri-Infarct Cortex	119
4.5	Dendritic Spine Alterations in Peri-Infarct Cortex	122
4.6	Reactive Astrocytes and Extracellular Matrix Changes in Peri-Infarct Cortex	123
4.7	The Effects of Ischemia on Distant Connected Brain Regions	125
4.8	Axonal Sprouting	126
4.9	Does Axonal Regeneration Recapitulate Development?	133
4.10	Neuronal and Glial Progenitor Responses after Stroke (Neurogenesis and Gliogenesis)	135
4.11	Reconciling Regeneration with (Behavioral) Recovery	137
4.12	Does Activity in the Injured Brain Make the Injury Worse?	138
4.13	Conclusions	139
5	A Hierarchical Framework for Tissue Repair after Stroke	141
5.1	First- and Second-Order Principles of Repair	141
5.2	Stroke Is Not just an Acute Killer but a Chronic Disabling Disease	142
5.3	Behavioral Activity Shapes Tissue Regeneration	143
5.4	The Suffered Is the Learned	145

5.5	The Motor Recovery Engram and CREB	147
5.6	Plasticity Is a Risk for Cell Death: Timing for a Neural Repair Therapy after Stroke	152
5.7	The Brain Forms Regenerative Cellular Niches during Repair and Recovery	153
5.8	Engaging CNS Tissue Regeneration Is Like Activating a Cancer	155
5.9	Neural Repair Therapies Must be Focused in Time and Space	155
5.10	Regeneration Does Not Recapitulate Development: The Meaning of "Phenotype"	156
5.11	Neuronal Networks in Motor Recovery: Second-Order Principles Interact	157
5.12	Conclusions	159
6	Chronic Hemiparesis: Motor Learning, Compensation, and the Challenge of Reversing Impairment in Late Stroke	161
6.1	Introduction	161
6.2	Motor Learning Principles for Neurorehabilitation	162
6.3	Compensation	171
6.4	Repetitive Task-Oriented Training	172
6.5	Constraint-Induced Movement Therapy	177
6.6	Robotic Therapy	180
6.7	Conclusions	183
7	Pharmacological and Cell Therapies for Recovery from Stroke	185
7.1	Introduction	185
7.2	Brief Overview of Stem Cell Therapy in Stroke	185
7.3	What Is a Stem Cell?	186
7.4	Types of Stem and Progenitor Cells in Brain Therapy	187
7.5	Mechanisms of Stem Cell Repair in Stroke	191
7.6	Translation of Stem Cell Preclinical Studies to the Clinic	193
7.7	Pharmacological Therapies for Stroke Recovery	198
7.8	Molecular Neurorehabilitation	207
8	A Future Approach to Neurorehabilitation after Stroke: If Humans Had Wings	209
8.1	Introduction	209
8.2	Video Games and Virtual Reality	209
8.3	Direct Physiological Interventions	211
8.4	Reopening the Sensitive Period	214
8.5	Precision Health and Recovery after Stroke	220
8.6	Conclusions	222
