

Quantum Theory for Chemical Applications

From Basic Concepts to Advanced Topics

JOCHEN AUTSCHBACH

OXFORD
UNIVERSITY PRESS

Contents

<i>Preface</i>	xi
<i>Abbreviations</i>	xix
<i>Notation Used in This Book</i>	xxi
<i>Motivation: Why It Is Important to Know What Quantum Theory Is About</i>	xxiii

PART I. BASIC THEORETICAL CONCEPTS

1. Vectors and Functions and Operators	3
Exercises	11
2. Classical Mechanics According to Newton and Hamilton	14
Exercises	26
3. The Quantum Recipe	27
3.1 The Postulates of Quantum Mechanics	28
3.2 The Quantum Recipe (Position Representation, Stationary States)	42
3.3 Matrix Representations of Quantum Operators	43
3.4 The Variation Principle	45
3.5 Major Differences between Classical and Quantum Mechanics, and the Heisenberg Uncertainty Relation	47
3.6 Meow!	49
Exercises	53
4. Atomic Units	56
Exercises	58
5. A First Example: The “Particle in a Box” and Quantized Translational Motion	59
5.1 Particle in a Box: One Dimension	59
5.2 Particle in a Box: Two Dimensions	65
5.3 Particle in a Box: Three Dimensions	71
5.4 Application of the 1D PiaB to the Electronic Spectroscopy of Linear π -Conjugated Molecules	74
5.5 Free Versus Confined Particles and the Tunneling Phenomenon	82
5.6 Quantum Behavior	93
Exercises	94

PART II. ATOMIC, MOLECULAR, AND CRYSTAL ORBITALS

6. Hydrogen-like Atomic Wavefunctions: A First Sketch	99
Exercises	106
7. Many-electron Systems and the Pauli Principle	109
7.1 Electrostatic Forces and Potential Energies	109

7.2 Separation of Electronic and Nuclear Degrees of Freedom	111
7.3 The Many-electron Hamiltonian	113
7.4 Electron Correlation Versus Hartree Product	115
7.5 The Pauli Principle	117
7.6 Slater Determinants and the Orbital Model	118
7.7 How to Create a Set of Orthonormal Orbitals	123
Exercises	125
8. Self-consistent Field Orbital Methods	128
8.1 The Energy Expectation Value Calculated with a Slater Determinant	128
8.2 Hartree-Fock Theory	134
8.3 The Self-consistent Field Cycle	137
8.4 Orbital Energies	138
8.5 Spin-restricted Versus Spin-unrestricted Hartree-Fock	139
8.6 Kohn-Sham Density Functional Theory (Very Briefly)	142
8.7 Ab Initio Versus Semiempirical Methods	147
Exercises	149
9. From Atomic Orbitals to Molecular Orbitals and Chemical Bonds	150
9.1 An <i>Aufbau</i> Procedure for Atomic Orbitals	150
9.2 Molecular Orbitals Formed by Linear Combinations of Basis Functions	154
9.3 Atomic Orbital-like Basis Functions	155
9.4 Non-AO Basis Sets	158
9.5 The HF Energy and the HF Equation in a Basis Set	159
9.6 Minimal Basis LCAO Calculations for H_2^+ and H_2	165
9.7 Helium, and the Slater Screening Rules Revisited	176
9.8 The Nature of the Covalent Bond and the Role of Kinetic Energy	177
9.9 Pauli Repulsion	182
9.10 A Typical Computational Chemistry Workflow	182
9.11 AO Basis Set-Dependent Charge and Bond-order Definitions	184
Exercises	185
10. Orbital-based Descriptions of Electron Configurations, Ionization, Excitation, and Bonding	188
10.1 Constructing an MO Diagram: Qualitative Aspects	189
10.2 Koopmans' Theorem	200
10.3 Orbital Energies Versus Total Energies: A Transition Metal Example	202
10.4 Electronic Excitations Versus Orbital Energy Gaps Versus Fundamental Gaps	205
10.5 Localized Molecular Orbitals and the Lewis Structure	207
10.6 Delocalized Versus Localized Bonding	208
10.7 Calculating Localized Molecular Orbitals from Canonical Molecular Orbitals	210
Exercises	216
11. Recap: Molecular Orbitals and Common Misconceptions	217
11.1 The Appearance of Molecular Orbitals as Linear Combinations of Atomic Orbitals in Molecular Electronic Structure Theory	217
11.2 Avoiding Common Misconceptions about Molecular Orbitals	225

12. Approximate Molecular Orbital Theory: The Hückel/ Tight-binding Model	231
12.1 Setup of the Basic HMO Model	231
12.2 HMO Treatment of Ethene	232
12.3 HMO Models for Linear and Cyclic Polyenes: Hexatriene Versus Benzene	234
12.4 Binding Energies, Partial Charges, and Bond Orders	237
12.5 What Is So Special about Benzene?	239
Exercises	245
13. Band Structure Theory for Extended Systems	246
13.1 The Electron Gas	246
13.2 Periodic Potentials and Bloch Functions in One Dimension	252
13.3 Band Structure for One-dimensional Periodic Systems from Hückel Theory	258
13.4 The Reciprocal Lattice	262
13.5 More Than One Dimension	265
13.6 Three-dimensional Periodic Solids: Metals Versus Semi-metals Versus Insulators	269
13.7 Band Structure Analysis: Orbital Populations, Projected Density of States, and Crystal Overlap Populations	274
Exercises	276

PART III. BASIC CONCEPTS OF QUANTUM THEORY—CONTINUED

14. Quantized Vibrational Motion	281
14.1 The Harmonic Oscillator	281
14.2 Vibrational Spectroscopy and the Morse Potential	287
14.3 Nuclear Vibrations in Polyatomic Molecules	292
Exercises	304
15. Quantized Rotational Motion in a Plane	306
15.1 Perimeter Model	306
15.2 Hindered Rotations	310
Exercises	312
16. Angular Momentum and Rotational Motion in Three Dimensions	313
16.1 Angular Momentum	313
16.2 Rigid Rotor: Three Dimensions	324
16.3 Rotational and Ro-vibrational Spectroscopy	325
Exercises	327
17. Hydrogen-like Atoms	328
17.1 The Hamiltonian and Separation of Variables	328
17.2 Solution of the Radial Equation	330
17.3 The Electronic States of Hydrogen-like Atoms: Symmetry, Degeneracy, and Radial Densities	333
17.4 Visualizing the Wavefunctions of Hydrogen-like Atoms	336
18. Particle in a Cylinder, in a Sphere, and on a Helix	340
18.1 Particle in a Cylinder	340
18.2 Particle in a Sphere	347

18.3 Particle on a Helix	352
Exercises	355
19. Electron Spin and General Angular Momenta	356
19.1 The discovery of the electron spin	356
19.2 The Operators for a Single-electron Spin	358
19.3 Many-electron Spin Functions, and Hund's Rule	360
19.4 Generalized Angular Momentum and Ladder Operators	364
19.5 Addition of Angular Momenta	367
Exercises	374

PART IV. ADVANCED TOPICS

20. Post-Hartree-Fock Methods and Electron Correlation: A Very Brief Overview	379
20.1 Static and Dynamic Correlation	379
20.2 Configuration Interaction	380
20.3 Truncated CI and the Problem with Size Consistency and Size Extensivity	385
20.4 Coupled-cluster Methods	388
20.5 Multireference Methods	391
20.6 Minimal Basis CI Calculation for H_2	392
20.7 Summary	398
Exercises	398
21. The One-electron Quantum Hamiltonian in the Presence of EM Fields	400
21.1 Maxwell's Equations and EM Waves	400
21.2 Electromagnetic Potentials	408
21.3 The Hamilton Function for a Charged Particle and EM Fields	410
21.4 Field-dependent One-electron Operators	414
Exercises	435
22. Static Perturbation Theory and Derivative Properties	436
22.1 Perturbation Series	436
22.2 Energy Perturbation in First Order	438
22.3 Perturbations Beyond the First-order Energy Correction	443
22.4 The MP2 Correlation Energy	447
22.5 Bilinear (Double) Perturbations	451
22.6 Perturbation Theory for Degenerate States	454
22.7 Perturbation Theory for Approximate Methods	460
Exercises	469
23. Dynamic Fields and Response Properties	473
23.1 Transition Probabilities	473
23.2 Electronic Absorption Intensities	481
23.3 Electronic Circular Dichroism	489
23.4 Response Functions and the Kramers-Kronig Transformations	497
23.5 Complex Dynamic Polarizability	504
23.6 Linear Response Functions	510
23.7 The Quasi-energy Formulation	515
23.8 Linear Response Functions with Excited-state Broadening	517

23.9 An Alternative Derivation of the Linear Response Function	522
23.10 Complex Optical Rotation	525
23.11 Time-dependent HF and KS Linear Response	531
23.12 Nonlinear Response Functions, Two-photon Absorption, and a Zoo of Properties	542
Exercises	553
24. From Schrödinger to Einstein and Dirac: Relativistic Effects	555
24.1 Why Do We Need Einstein's Relativity in Chemistry?	555
24.2 Special Relativity	556
24.3 Four-component and Two-component Relativistic One-electron Hamiltonians	558
24.4 Relativity and Heavy Atoms	567
24.5 SO Coupling and SO Splitting of Atomic Terms	571
24.6 Intersystem Crossing and Phosphorescence	575
24.7 The X2C One-electron Hamiltonian	576
24.8 Molecular Properties and Picture Change	589
Exercises	591

PART V. APPENDIX

A. Complex Numbers	595
B. Linear Algebra Essentials	597
B.1 Matrices and Vectors	597
B.2 Special Types of Matrices and Matrix Operations	599
B.3 Determinants	601
B.4 Linear Equation Systems	603
B.5 Eigenvalues and Eigenvectors, and Functions of Matrices	605
B.6 The Scalar Product and Basis Vectors	610
B.7 Basis and Coordinate Transformations	611
B.8 Functions Versus Vectors	615
B.9 Generalized Eigenvalue Problem	616
C. Some Useful Relationships Involving Functions, Vectors, Vector Fields, and the Operator ∇	619
D. One- and Two-center Integrals with 1s Slater-type Functions	626
E. Point Group Symmetry	632
E.1 Molecular Symmetry Point Groups and Character Tables	632
E.2 Symmetry-allowed Versus Symmetry-forbidden Transitions	636
E.3 Symmetry-adapted Molecular Vibrations	639
E.4 Some Important Results from Symmetry Group Representation Theory	643
E.5 The Symmetry Projector	645
E.6 Symmetry-adapted Orbitals	647
F. Ensembles of Electrons and Quantum Statistics	650
