PART I BASIS OF THE THEORY

1	Introduction	3
1.1	Overview	3
1.2	The Prehistory of Quantum Mechanics: atomism	5
1.3	Religion and science	11
1.4	Birth of the modern atomic theory of matter	13
1.5	Atomism and physics	15
2	Properties of the quantum world: indeterminacy, interference, superposition, entanglement	22
2.1	Indeterminacy—random behavior	22
2.2	The wave nature of light and matter and its connection with random behavior	24
2.3	Superposition and projection	30
2.4	Entanglement—“spooky action at a distance”	35
2.5	The Aharonov-Bohm effect and the physical reality of electromagnetic potentials	36
2.6	Quantum mechanics and precision measurements	39
2.7	Synopsis	43
3	The origin of quantum theory in the crisis of classical physics	45
3.1	Black body radiation	45
3.2	Einstein further develops the quantum idea	54
3.3	The Bohr atom	63
3.4	Conclusion	65
4	Further steps to quantum mechanics: the old quantum mechanics of Bohr and Sommerfeld	66
4.1	Quantization conditions	66
4.2	“Old” quantum theory	67
4.3	Toward quantum mechanics: classical mechanics as the limit of a wave motion	75
4.4	Conclusion	77
5	Further steps to quantum mechanics: Louis de Broglie and the world’s most important PhD thesis	78
5.1	Introduction	78
5.2	De Broglie’s contribution	79
5.3	Appendix to Chapter 5—Compton scattering	86

6	The invention of quantum mechanics—matrix mechanics	87
6.1	Introduction	87
6.2	Heisenberg rediscovers matrices	88
6.3	The founding of matrix mechanics by Born, Jordan, and Heisenberg	90
6.4	Further developments	101
6.5	Conclusion	101
7	Schrödinger and the development of wave mechanics	103
7.1	Ideas leading to wave mechanics	103
7.2	The development of wave mechanics as presented in Schrödinger's publications	111
7.3	First applications of the wave equation	118
7.4	The relation between matrix and wave mechanics	128
8	Further developments of wave mechanics by Schrödinger	138
8.1	Introduction	138
8.2	Perturbation theory	138
8.3	The time-dependent Schrödinger equation	140
8.4	Conclusion	147
9	Quantum statistics and the origin of wave mechanics	149
9.1	Bose-Einstein statistics	149
9.2	Fermi-Dirac statistics	173
9.3	Conclusion	193
10	Early attempts at interpretation of the theory	196
10.1	Introduction	196
10.2	Schrödinger and the spreading of wave packets	196
10.3	Born's insight and the loss of determinacy in physics	200
10.4	Heisenberg's uncertainty principle	206
10.5	Niels Bohr and complementarity: the Copenhagen interpretation of quantum mechanics	214
10.6	Conflicting views on quantum jumps	216
10.7	Chronology of Bohr-Heisenberg-Schrödinger discussions	220
11	The final synthesis of quantum mechanics: the “transformation theory” and Dirac notation	221
11.1	Introduction	221
11.2	Sturm-Liouville theory, Hilbert space, and linear operators	224
11.3	Dirac's bra-ket notation	234
11.4	General features of the theory and Dirac notation	242
12	Dirac and Jordan commit “sin squared”: second quantization and the beginning of quantum field theory	245
12.1	Introduction	245
12.2	Dirac's q-numbers, operators, and the quantum mechanics of Dirac, Jordan, and von Neumann	246

12.3	The beginning of quantum field theory	254
12.4	Ehrenfest's theorem and the classical limit of quantum mechanics	290
12.5	Stability of matter—second quantization	291
13	The “completion of quantum mechanics”—the fifth Solvay Conference on Physics, October 1927	293
13.1	Introduction	293
13.2	The collapse of the wave function and its meaning—the measurement problem	296
13.3	Wave-particle duality	299
13.4	Einstein and Bohr: the battle of the century?	308
13.5	The question of $3N$ dimensions	319
13.6	Conclusion	320
14	Von Neumann's mathematical foundations of quantum mechanics: redux	321
14.1	Introduction	321
14.2	Von Neumann's measurement theory	324
14.3	No hidden parameters proof	327
14.4	Von Neumann entropy	335
14.5	Conclusion	339
15	Einstein and Schrödinger renew the assault on quantum mechanics	343
15.1	Introduction	343
15.2	Einstein attacks quantum theory	346
15.3	Reactions to the Einstein Podolsky Rosen (EPR) argument	351
15.4	Summary of historical commentary	367
15.5	Bell inequalities	368
15.6	Entangled photons	369
15.7	Entanglement in the density matrix	378
15.8	Conclusion	388
16	Weimar culture and quantum mechanics	391
16.1	Introduction	391
16.2	The Weimar Republic, a brief history	392
16.3	Weimar culture ¹	405
16.4	Physics in the Weimar Republic	411
16.5	Conclusion	433
17	Further development of the interpretation of quantum theory	435
17.1	Introduction	435
17.2	Schrödinger	438
17.3	London and Bauer	440
17.4	David Bohm	447
17.5	Hugh Everett III and the world's second most important PhD thesis(?)	453
17.6	Decoherence	468

17.7 (Spontaneous) Direct wave function collapse	489
17.8 Second quantization and particle-wave duality	493
17.9 Conclusion	494

PART II APPLICATIONS OF QUANTUM MECHANICS

18 Operator techniques and the algebraic solutions of problems	501
18.1 Introduction	501
18.2 Uncertainty relationships via operator techniques	502
18.3 Pictures	504
18.4 Ladder operators	512
18.5 Harmonic oscillator	513
18.6 Coherent states	517
18.7 Two-dimensional harmonic oscillator	537
18.8 2D harmonic oscillator solution to the H atom	540
18.9 Sum rules and summation techniques	542
18.10 Benzene molecule	559
18.11 Angular momentum: an operator approach	561
18.12 Algebraic derivation of the hydrogen spectrum	583
18.13 The WKB approximation: boundary conditions by complex analysis	591
19 Spin-1/2 and two-level systems	597
19.1 Larmor's theorem	597
19.2 Pauli matrices	605
19.3 Vector representation of spin and spinor rotation symmetry	606
19.4 The effects of near-resonant oscillating magnetic fields	610
19.5 Effects of time-dependent, nonresonant variations of the potential	612
19.6 The density matrix	621
19.7 General application to two-level systems: fictitious spin-1/2	628
20 Path integrals and scattering	635
20.1 Introduction	635
20.2 Path integrals	635
20.3 An introduction to scattering of nonrelativistic particles by a many-body system	643
20.4 Conclusion	657
21 Introduction to quantum computing (with the assistance of Edward D. Davis)	659
21.1 Overview	659
21.2 The basic ideas	668
21.3 Unitary operations	672
21.4 A physical model of a quantum computer	676
21.5 Some additional algorithms	679
21.6 Factoring—the Holy Grail of quantum computing	683
21.7 Conclusion	693

APPENDICES

A	Classical mechanics	696
	A.1 Introduction	696
	A.2 Lagrangian mechanics	696
	A.3 Hamiltonian mechanics	703
	A.4 Transformations of coordinates—canonical transformations and the Hamilton-Jacobi equation	705
	A.5 Action-angle variables	710
	A.6 Conclusion	714
B	Galilean invariance of the Schrödinger equation	715
	B.1 Alternative test of Galilean invariance	718
	B.2 Internal coordinates and momenta for a two- and multi-particle system	718
C	Universality of Planck’s constant	720
D	Conservation laws	722
E	Lagrangian and Hamiltonian formalism for classical fields	726
	E.1 Lagrangian for a classical continuous field: example of a vibrating string	726
	E.2 Lagrange’s equations for a classical continuous field	727
	E.3 Hamiltonian formulation for classical continuous fields	728
	Index	731
