

Population Genetics with R

An Introduction for Life Scientists

**ÁKI J. LÁRUSON
& FLOYD A. REED**

OXFORD
UNIVERSITY PRESS

Contents

<i>Acknowledgements</i>	v
Chapter 1: Learning through Programming	1
1.1 Introduction	1
1.2 Organization	5
Chapter 2: Downloading and Installing R	7
2.1 Introduction to R	8
2.2 Working directories and saving	12
Chapter 3: Basic Commands in R	15
3.1 Input and calculations	15
3.2 Assigning objects to variables	18
3.3 Parts of a function	19
3.4 Classes of objects	22
3.5 Matrices	27
Chapter 4: Allele and Genotype Frequencies	35
4.1 Introduction to population genetics	35
4.2 Simulating genotypes	46
4.3 Calculating allele frequencies from datasets	56
Chapter 5: Statistical Tests and Algorithms	65
5.1 Deviation from expectations	65
5.2 Extending to more than two alleles	73
5.3 Blood types and allele frequencies	83
5.4 Expectation Maximization algorithm	87

Chapter 6: Genetic Variation	93
6.1 Genetic drift and evolutionary sampling	93
6.2 Variation over time	109
6.3 Quantifying variation	116
6.4 Equilibrium heterozygosity and effective population size	121
6.5 Overlapping generations	123
Chapter 7: Adaptation and Natural Selection	125
7.1 Positive selection	125
7.2 Adaptation, diploidy and dominance	133
Chapter 8: Population Differences	155
8.1 Quantifying divergence	155
8.2 Relative likelihood of the population of origin	159
8.3 DNA fingerprinting	167
Chapter 9: Pointing the Way to Additional Topics	171
9.1 The coalescent	172
9.2 Tests of neutrality	182
9.3 Linkage disequilibrium	185
9.4 Deleterious alleles	189
9.5 Fixation probability under selection and drift	190
9.6 Selfish genes	193
9.7 Broadening the models	195
9.8 R packages	196
