

THEORETICAL APPROACHES IN BIOARCHAEOLOGY

*Edited by Colleen M Cheverko, Julia R Prince-
Buitenhuis and Mark Hubbe*

CONTENTS

<i>List of illustrations</i>	<i>vii</i>
<i>List of contributors</i>	<i>ix</i>
<i>Foreword: Theory in bioarchaeology matters</i>	<i>xi</i>
1 Theory in bioarchaeology: An introduction <i>Colleen M Cheverko, Julia R Prince-Buitenhuis and Mark Hubbe</i>	1
2 Embodying bioarchaeology: Theory and practice <i>Sarah A Schrader and Christina Torres-Rouff</i>	15
3 Gender in bioarchaeology <i>Molly K Zuckerman</i>	28
4 Bioarchaeological applications of intersectionality <i>Sharon N DeWitte and Samantha L Yaussy</i>	45
5 Life course approaches and life history theory: Synergistic perspectives for bioarchaeology <i>Colleen M Cheverko</i>	59
6 Reconstructing immune competence in skeletal samples: A theoretical and methodological approach <i>Fabian Crespo</i>	76
7 Niche construction theory in bioarchaeology <i>Julia R Prince-Buitenhuis and Eric J Bartelink</i>	93

ILLUSTRATIONS

Figures

6.1	Diagram that shows how systemically, before and after chronic inflammatory insult, different bone lesions could increase bone alteration or resorption, informing about a hyper inflammatory phenotype	81
6.2	Diagram showing the three dimensional/component analysis for the reconstruction of the skeletal inflammatory index (SINDEX). In the diagram, an over reactive inflammatory response was represented in PD and PL (higher PD and PL severity), but other lesions could be included in the analysis (i.e., osteomyelitis, osteoarthritis)	84
6.3	Number/field of TRAP+ staining osteoclast (graph) and morphological results (corresponding top photos ×20) after 14 days of osteoclast differentiation protocol using monocytes derived from healthy human PBMCs (III) and either exposed to: UNT (culture with media but no osteoclastogenic factors – OCGF [RANKL + M – CSF]); CON (culture with media + OCGF); CON + SP (culture with media + OCGF + supernatant from untreated immune cells); CON + SP47 (culture with media + OCGF + supernatant from immune cells exposed to <i>Treponema pallidum</i> antigen TP47 –24 hrs (I))	86
6.4	Diagram showing a syndemic approach where factors during an individual’s lifespan can exacerbate or decrease systemic inflammation, causing modifications to SINDEX observed during adulthood	87

7.1 Simplified model of human niche construction highlighting the interchange between scales of environment, human systems, and individuals	98
7.2 Model of human niche construction in the context of late Holocene reflecting predictions and observations from case study	103
8.1 The adaptive cycle modeled after Holling and Gunderson (2002)	114
10.1 Percentage of hip fractures by institution	161

Tables

8.1 Hypotheses attributable to resilience theory that are possible to test using bioarchaeological data sets	117
10.1 Institutionalization analyses of Terry individuals born from 1800 to 1877	158
10.2 Hip fracture analyses of Terry individuals born from 1800 to 1877	159
10.3 Hip fracture presence and institutionalization analyses of Terry individuals born from 1800 to 1877	160

Boxes

2.1 Embodying intimacy: Cranial vault modification as child rearing practice	21
3.1 Mercury in the midst of Mars and Venus: Reconstructing gender and socioeconomic status in the context of mercury treatments for acquired syphilis in 17th to 19th century London	38
4.1 The intersections of sex, socioeconomic status, age at death, and skeletal indicators of frailty in 18th- and 19th-century England	53
5.1 Towards a contextualized life course–life history approach	68
6.1 How can osteoimmunology inform bioarchaeology?	84
7.1 Niche construction in bioarchaeology: Late Holocene hunter-gatherers of central California	101
8.1 Resilience and adaptability in the Late/Final Jomon period: Adaptive cycle modeling in a cooling climate	124
9.1 Contextualizing skeletal stress in San Jose, California (1875–1925)	139
