Introduction	1
1 General relativity, kinematics: metric, parallel transport, and general coordinate invariance	3
1.1 Lightning review of SR	3
1.2 General relativity: curved spacetimes	4
1.3 Intrinsically curved spaces and non-Euclidean geometry	7
1.4 Einstein's theory of general relativity	9
1.5 Kinematics	11
1.6 Motion of free particles	15
2 General relativity, dynamics: curvature, the Einstein–Hilbert action, and the Einstein equation	18
2.1 Curvature	18
2.2 Properties of the Riemann tensor	21
2.3 Actions in general relativity	22
2.4 The Einstein–Hilbert action	23
2.5 Einstein's equations	25
2.6 Energy–momentum tensor and general form of the Einstein's equations	27
2.7 Interpretation of Einstein's equations	30
3 Perturbative gravity: Fierz–Pauli action and gauge conditions	33
3.1 Fierz–Pauli action for small fields	33
3.2 Gauge invariance and the de Donder gauge	36
3.3 Transverse-traceless (TT) gauge	37
3.4 Synchronous gauge	39
4 Gravitational waves: perturbation, exact solutions, generation, and multipole expansion	42
4.1 Radiation in TT gauge	42
4.2 The gravitational field of a mass distribution	44
4.2.1 The electromagnetic multipole expansion	44
4.2.2 Gravity: multipole expansion	45
4.3 Gravitational radiation from a source	47
4.4 The pseudotensor of the gravitational field	48

4.5	The power radiated through gravitational waves	49
4.6	Exact cylindrical gravitational waves (Einstein–Rosen) solution	50
5	Nonperturbative gravity: the vacuum Schwarzschild solution	54
5.1	Newtonian limit	54
5.2	Ansatz and equations of motion	56
5.2.1	Ansatz	56
5.2.2	Christoffel symbols	56
5.2.3	Ricci components	57
5.3	Solution to the equations of motion	59
6	Deflection of light by the Sun and comparison with special relativity	64
6.1	Motion of light as motion in a medium with small, position-dependent index of refraction	65
6.2	Formal derivation using the Hamilton–Jacobi equation	69
6.2.1	Quick review of the Hamilton–Jacobi theory	69
6.2.2	Deflection of light by the Sun	70
6.3	Comparison to special relativity	73
7	The other classical tests of general relativity: the gravitational redshift, the perihelion precession, and the time delay of radar	75
7.1	Gravitational redshift	75
7.2	Geodesic radial motion	76
7.3	Time delay of the radar signal	78
7.4	Precession of the perihelion of the ecliptic	78
7.5	Motion in the Schwarzschild metric by nonrelativistic analogy	81
7.5.1	Null geodesic motion	83
8	Vielbein–spin connection formulation of general relativity: gravity vs. gauge theory, in four dimensions and three dimensions	86
8.1	Vielbein–spin connection formulation	86
8.2	Fermions in general relativity	90
8.3	Gravity vs. gauge theory, in four dimensions and in three dimensions	91
9	Gravity and geometry, Lovelock and Chern–Simons, topological terms, extensions, and anomalies	96
9.1	Gravity and geometry	96
9.2	Lanczos–Lovelock Lagrangian	99
9.3	Anomalies	100
10	The ADM parametrization and applications	105
10.1	ADM parametrization	105
10.2	Extrinsic curvature	106
10.3	Gauss–Codazzi equations for embedding	107

10.4	Killing vectors	108
10.5	Asymptotic flatness and the BMS group	108
10.5.1	Asymptotic flatness and definitions of mass	109
10.6	Boundary terms in the gravitational action	112
11*	Canonical formalism for gravity, the Wheeler–de Witt equation, and the canonical quantization of gravity	116
11.1	Canonical formalism for gravity	116
11.2	A quick review of the Dirac formalism	117
11.3	Hamiltonian constraint and momentum constraint	118
11.4	The Brown–York stress tensor	119
11.5	The Wheeler–de Witt equation	119
11.5.1	Interpretation and wave functions	121
11.6	*Ashtekar variables (difficult subject, can be skipped)	123
12	Gravitoelectric and gravitomagnetic fields and applications	128
12.1	Electromagnetic analogy	128
12.2	Covariant form	130
12.3	Electromagnetism and tidal forces and tensors	131
12.3.1	Maxwell’s equations as equations for tidal tensors	132
12.4	Gravitational analog of the above	132
12.5	Application: the Lense–Thirring effect and “frame dragging”	133
12.6	Application: the clock effect	134
13	Penrose diagrams and black holes: the Schwarzschild example	137
13.1	Penrose diagrams: definition	137
13.2	Example 1: two-dimensional Minkowski	137
13.3	Example 2: d -dimensional Minkowski	139
13.4	Example nr. 3: Anti-de Sitter space in Poincaré coordinates (the Poincaré patch)	139
13.5	Black holes and the Schwarzschild example	143
14	Reissner–Nordstrom black hole spacetime and extremal black holes	149
14.1	The Reissner–Nordstrom solution	149
14.2	Horizons and extremality	150
14.3	Penrose diagram of the Reissner–Nordstrom solution	152
15	Kerr and Kerr–Newman black hole spacetimes and the Penrose process	158
15.1	The Kerr–Newman solution	158
15.2	Symmetries	159
15.3	Causal structure	162
15.4	Penrose process	165
16	Trapped surfaces, event horizons, causality, and topology	168
16.1	General definitions	168

16.2	Congruence, convergence, and trapped, and marginally trapped surfaces	170
16.3	Example of marginally trapped surface different from the event horizon	172
16.4	Horizons: de Sitter spacetime	174
16.5	Rindler spacetime: accelerated spacetime with event horizon	176
17	The Raychaudhuri equation	180
17.1	Description of event horizons	180
17.2	Surface gravity (of the horizon)	181
17.3	Horizon formulae	182
17.4	The Raychaudhuri equation	183
17.5	Application: horizons with null geodesics	185
18	The laws of black hole thermodynamics and black hole radiation	188
18.1	Laws of regular thermodynamics	188
18.2	Laws of black hole thermodynamics	188
18.3	(Partial) Proofs	190
18.3.1	Zeroth law	190
18.3.2	First law	192
18.3.3	Second law	194
18.3.4	Third law	194
18.4	Thermodynamic potential	196
19	Wald entropy and Sen's entropy function formalism	199
19.1	Wald entropy	199
19.2	Sen's entropy function formalism	200
19.3	Effective potential and existence of attractor = horizon	204
20	Energy conditions, singularity theorems, and wormholes	209
20.1	Energy conditions	209
20.2	Energy conditions and singularities	211
20.3	Hawking and Penrose theorems on the existence of singularities	212
20.4	Wormholes	215
21	Relativistic stars and gravitational collapse to black holes	219
21.1	Relativistic stars	219
21.2	The Tolman–Oppenheimer–Volkoff equation	222
21.3	Stellar models	223
21.4	The Chandrasekhar limit	225
21.4.1	The Tolman–Oppenheimer–Volkoff limit	226
21.5	Gravitational collapse to black holes	226
22	Effective field theory from gravity and black holes	231
22.1	Quantum field theory concepts	231

22.2	Worldline formalism and gravity	234
22.2.1	Electromagnetic analogy	236
22.2.2	Gravity	237
22.3	Nonrelativistic regime	239
22.4	Example: scalar gravity with scalar field ϕ and interacting with a source current	240
22.5	Non-relativistic general relativity (NRGR)	241
23	General relativity solutions and the gauge theory double copy	248
23.1	Motivation: KLT relations and BCJ relations	248
23.2	Double copy in Kerr–Schild coordinates	250
23.3	Examples	252
23.3.1	Schwarzschild black hole	252
23.3.2	Kerr black hole	253
23.3.3	PP waves	254
23.3.4	The Taub–NUT solution	254
23.4	The Weyl double copy	256
23.5	General Petrov type D example	257
24	The fluid–gravity correspondence	261
24.1	Viscous relativistic fluids	261
24.2	Conformal fluids	262
24.3	Conformal fluid from asymptotically AdS space	264
24.4	Membrane paradigm	266
24.4.1	Observation	268
24.5	The Navier–Stokes scaling limit	268
25	Fully linear gravity example: parallel plane (pp) wave and gravitational shockwave solutions	272
25.1	PP waves	272
25.1.1	Christoffel symbols and Ricci tensors	273
25.2	The Penrose limit and theorem	274
25.2.1	From Rosen coordinates to Brinkmann coordinates	275
25.2.2	The Penrose limit as boost	276
25.3	Example: Penrose limit of $AdS_3 \times S^3$	276
25.4	Gravitational shockwaves in flat space	277
25.4.1	Example: point source	278
25.4.2	General shockwaves	279
25.4.3	Examples: shockwaves generated by a planar source and by a graviton	279
25.5	Gravitational shockwaves in other backgrounds	280
25.6	The Khan–Penrose interacting solution	281
26	Dimensional reduction solutions: the domain wall, the cosmic string, and the three-dimensional BTZ black hole solutions	286
26.1	Domain wall	286

26.1.1	Ansatz	286
26.1.2	Einstein's equations	287
26.2	The domain wall solution	288
26.2.1	Perturbative nonrelativistic solution	288
26.2.2	Exact relativistic solution	289
26.2.3	Dimensional reduction	289
26.3	Cosmic string	290
26.3.1	Ansatz	290
26.3.2	Einstein's equations	290
26.4	Cosmic string solution via dimensional reduction	292
26.5	Cosmic string: alternative derivation at weak field	294
26.6	The BTZ black hole solution in 2+1 dimensions and Anti-de Sitter space	295
26.6.1	Christoffel symbols	295
26.6.2	Ricci tensors	296
26.6.3	The BTZ black hole solution	296
27	Time-dependent gravity solutions: the Friedmann–Lemaître–Robertson–Walker (FLRW) cosmological solution, de Sitter and Anti-de Sitter cosmologies	299
27.1	Cosmological equations	300
27.1.1	Metric ansatz	300
27.1.2	Christoffel symbols	302
27.1.3	Ricci tensors	303
27.2	Cosmological solution to Einstein's equations	304
27.3	Cosmological models (types of matter)	305
27.4	de Sitter and Anti-de Sitter spaces	307
27.4.1	de Sitter space	307
27.4.2	Anti-de Sitter space	308
28	General relativistic aspects of inflationary cosmology	311
28.1	Some of the problems with standard cosmology before inflation	311
28.2	The paradigm of inflation	313
28.3	Inflationary solutions to cosmological problems	314
28.4	Inflation with a single scalar field	315
28.5	Slow-roll inflation	316
28.6	Scalar fluctuations during inflation	318
29	The (parametrized) post-Newtonian expansion and metric frames	323
29.1	Parametrized post-Newtonian (PPN) formalism	323
29.1.1	Energy–momentum tensor	326
29.1.2	Equations of motion	326
29.2	Many-body systems and the PPN limit of general relativity	327
29.3	PN order and effective field theory	328
29.4	Metric frames, the Brans–Dicke theory and Jordan frames	331

30 The Newman–Penrose formalism	336
30.1 Covariant derivative relations	336
30.2 Basis vectors and spin coefficients	337
30.3 Commutation and transport relations	339
30.4 Transformation of null frame	342
30.5 Spinorial notation	342
30.6 Applications	345
31 The Petrov classification	348
31.1 Petrov types	348
31.2 The Newman–Penrose formalism	349
31.3 Examples and physics of types	352
32 The Bianchi classification of Lie algebras, Riemannian manifolds, and cosmologies	354
32.1 Lie algebra classification	354
32.2 Three-dimensional invariant Riemann spaces: Bianchi spaces	356
32.3 Homogenous Bianchi cosmologies	358
32.3.1 Kasner spacetime	358
32.3.2 Mixmaster universe	359
33 Nontrivial topologies: gravitational instantons, Taub–NUT, KK monopole, and Gödel spacetimes	362
33.1 Taub–NUT solutions	362
33.2 Hawking’s Taub–NUT and Page’s Taub gravitational instantons	364
33.3 The Eguchi–Hanson metric and a YM-like ansatz	365
33.3.1 Yang–Mills instanton	365
33.3.2 Preliminaries in gravity	367
33.4 Instanton ansätze and solutions	368
33.5 Gibbons–Hawking multi-instanton solution	370
33.6 The KK monopole	371
33.7 The Gödel Universe	372
